Mail Stop Petition

Commissioner for Patents

P.O. Box 1450

Alexandria, VA 22313-1450

PETITION TO WITHDRAW HOLDING OF ABANDONMENT UNDER 37 CFR 1.181(a)

Sir:

This Petition to withdraw a holding of abandonment is being filed as a result of a Notice of Abandonment dated March 27, 2006. This Petition is being filed within two (2) months thereof.

The abandonment is apparently predicated upon the failure of the Patent Office to receive a response to the non-final rejection dated August 9, 2005, which would have been due on November 9, 2005 (shortened statutory three month period). However, Applicants in fact mailed an Amendment to the Patent Office on November 8, 2005, in response to the Office Action, as evidenced by (a) the enclosed copy of the Express Mail receipt, showing receipt in the U.S. Postal Service system on November 8, 2005, of documents related to Applicants' docket number PD-10003472-1 and (b) the enclosed copy of Applicants' return post card receipt, showing receipt of Applicants' Amendment in the Patent Office on November 8, 2005 ("OIPF NOV 08, 2005").

Serial No. 10/001,756..... Page 2

M.P.E.P. §711.03(c)(I) sets forth the procedures to be followed in these circumstances. First, no fee is required of Applicants [M.P.E.P. §711.03(c)(I)]. Second, where there is disagreement as to whether the application is in fact abandoned, then the appropriate course of action is a petition under 37 CFR 1.181(a) [M.P.E.P. §711.03(c)(I)].

In addition to the proof that Applicants actually timely submitted their Amendment, as indicated above, Applicants provide herewith a copy of the Amendment as mailed to the Patent Office on November 8, 2005.

It is respectfully submitted that the enclosed copies of the indicated documents establish that Applicants timely responded to the Office Action dated August 9, 2005. Accordingly, Applicants request a withdrawal of any holding of abandonment and, further, that prosecution in this application be resumed.

Respectfully submitted,

April 24, 2006

AMENDMENT

Sir:

This is in response to the Office Action dated August 9, 2005, rejecting Claims 1, 6, 8, and 9, objecting to Claims 10-15, and withdrawing Claims 16-45 in the above-identified patent application. Amendments to the claims start on page 2 hereof and Remarks start on page 15 hereof.

COPY

Serial No. 10/001,756 Page 2

AMENDMENTS TO THE CLAIMS

The following is a listing of all claims in the application, wherein Claim 1 is amended and Claims 16-45 are cancelled as follows:

1. (currently amended) A bistable molecule for a multiple electrode device, said multiple electrode device comprising at least one pair of electrodes that form at least one junction and at least one said bistable molecule connecting said pair of electrodes in said junction, said junction having a functional dimension in nanometers or micrometers, said bistable molecule including at least one photosensitive, photodecomposable functional group, wherein said bistable molecule comprises a main chain and at least one pendant group and wherein at least one photosensitive, photodecomposable functional group is attached either to said main chain or to said pendant group, said bistable molecule exhibiting bistability irrespective of the presence or absence of said at least one photosensitive, photodecomposable group.

Claims 2-5 (canceled)

6. (original) The bistable molecule of Claim 1 wherein said photosensitive functional group is sensitive to ultraviolet, electron-beam, or X-ray radiation.

7. (canceled)

8. (previously presented) The bistable molecule of Claim 1 wherein one said photosensitive group is attached to at least one end of said bistable molecule.

9. (previously presented) The bistable molecule of Claim 1 wherein said photosensitive group is selected from the group consisting of α -carboxy-2-nitrobenzyl; 1-(2-nitrophenyl)ethyl; 4,5-dimethoxy-2-nitrobenzyl; 1-(4,5-dimethoxy-2-nitrophenyl)ethyl; (4,5-dimethoxy-2-nitrobenzyloxy)carbonyl; 5-carboxymethoxy-2-nitrobenzyl; [(5-carboxymethoxy-2-nitrobenzyl)oxy]carbonyl; desoxybenzoinsyl; and anthraquinon-2-ylmethoxycarbonyl.

COPY

Serial No. 10/001,756 Page: 3

10. (original) The bistable molecule of Claim 1 wherein said molecule evidences switching based on electric (E) field induced band gap change, selected from the group consisting of:

5 (1) an electric field ("E-field") induced rotation of at least one rotatable section (rotor) of a molecule to change the band gap of the molecule (rotor/stator configuration);

(2) E-field-induced charge separation or recombination of the molecule via chemical bonding change to alter the band gap:

10 (2a) E-field-induced band gap change caused by the change of extended conjugation via charge separation or recombination accompanied by increasing or decreasing π - and/or p-electron localization;

(2b) E-field-induced band gap change caused by a change of extended conjugation via charge separation or recombination and π -bond breaking or formation; and

(3) E-field-induced band gap change via molecular folding or stretching.

A⁻ is an Acceptor group comprising an electron-withdrawing group selected from the group consisting of (a) carboxylic acid and its derivatives, (b) sulfuric acid and its derivatives, (c) phosphoric acid and its derivatives, (d) nitro, (e) nitrile, (f) hetero atoms selected from the group consisting of N, O, S, P, F, Cl, and Br, (g) functional groups with at least one of said hetero atoms, (h) saturated or unsaturated hydrocarbons, and (i) substituted hydrocarbons;

D⁺ is a Donor group comprising an electron-donating group selected from the group consisting of (a) hydrogen, (b) amines, (c) OH, (d) SH; (e) ethers, (f) saturated or unsaturated hydrocarbons, (g) substituted hydrocarbons, and (h) functional groups with at least one hetero atom selected from the group consisting of B, Si, I, N, O, S, and P, wherein said Donor group is more electropositive than said Acceptor group;

Con₁ and Con₂ are connecting units between one molecule and another molecule or between a molecule and a substrate, said connecting units containing an attaching unit and at least one of said connecting units containing said photosensitive group, wherein said photosensitive group is selected from the group consisting of photosensitive azo, photosensitive ester, photosensitive ether, photosensitive amide, photosensitive imide, photosensitive amine, photosensitive imine, photosensitive carbonate, photosensitive carbamate, photosensitive thio-ether, photosensitive thio-ester, photosensitive isocyanides, and photosensitive heteroring systems with at least one hetero-atom selected from the group consisting of N, O, S, B, and P, and wherein the attaching unit is selected from the group consisting of (a) carboxylic acid and its derivatives, (b) sulfuric acid and its derivatives, (c) phosphoric acid and its derivatives, (d) hetero atoms selected from the group consisting of N, O, S, B, Se, and P, (e) functional groups with at least one of said hetero atoms (f) hydrocarbons, and (g) substituted hydrocarbons;

X₁, X₂, X₃ are tuning units built into the ring system which serve to tune the electronic properties, the optical properties, or both, of the bistable molecule as well those of the ring system undergo a smooth and desired tautomerization transition under the influence of an applied external E-field, wherein the tuning units are selected from the group consisting of a hetero atom selected from the group consisting of N, P, and As; hydrocarbons; and substituted hydrocarbons;

G₁ and G₂ are bridging groups for connecting stator and rotor portions of said bistable molecule or for connecting two or more fragments to achieve desired molecular properties,

COPY

Page 15

REMARKS

Claims 1, 6, and 8-15 remain in the application; Claims 16-45 have been canceled. Claim 1 is amended to emphasize distinctions over cited art.

Applicants appreciate that the rejections under 35 USC 112, second paragraph, have been withdrawn.

Claims 1, 6, 8, and 9 are rejected under 35 USC 102(b) as being anticipated by Van Allan et al (U.S. Patent 4,282,354).

Van Allan et al disclose an electrophoretic migration imaging process, involving materials having the structure

The materials are purportedly useful in electrophoretic migration imaging processes.

Applicants' Claim 1, as amended, recites

1. A bistable molecule for a multiple electrode device, said multiple electrode device comprising at least one pair of electrodes that form at least one junction and at least one said bistable molecule connecting said pair of electrodes in said junction, said junction having a functional dimension in nanometers or micrometers, said bistable molecule including at least one photosensitive, *photodecomposable* functional group, wherein said bistable molecule comprises a main chain and at least one pendant group and wherein at least one photosensitive, photodecomposable functional group is attached either to said main chain or to said pendant group, said bistable molecule exhibiting bistability irrespective of the presence or absence of said at least one photosensitive, photodecomposable group.
(Emphasis added.)

The Examiner reproduces Table 1 from Van Allan and argues that the compounds listed therein anticipate the recited scope for the claimed bistable molecule.

First, the arguments presented with regard to Van Allan et al in Applicants' previous Amendment filed May 12, 2005, obtain here as well.

Second, the following exposition is provided for the benefit of the Examiner:

Serial No. 10/001,756

Page 16

Applicants' invention is directed to how to make photo-patternable molecular circuitry. Van Allan et al is directed to electro-photography.

Van Allan et al disclose the use of some photosensitive chemicals to generate charges or change charge polarity of the molecules first. Then they use an electrophoretic method to migrate the photo-charged chemical to one of the surfaces to obtain an image. On the other hand, Applicants use their device molecules with photosensitive groups to deposit a film on electrodes first, and then expose portions of the bistable molecular film to irradiation (ultraviolet, electron-beam, or X-ray), decompose the exposed molecular material, and remove unwanted portions of the bistable molecular film to provide a photo-patterned molecular film after that.

The key difference is that the photo-sensitive materials of Van Allan et al are *photo-chargeable* materials, whereas Applicants' photosensitive materials are *photo-decomposable* materials. The molecules of Van Allan et al are merely electrically charged during the process and do not undergo material decomposition, whereas Applicants' molecules are changed to a completely new chemical species after exposure to the irradiation.

Another difference is that Van Allan et al use an electrophoretic method to generate a pattern for consumer printing or copying purpose, whereas Applicants use a conventional lithographic process incorporated with their novel photo-decomposable molecular device to generate molecular circuitry and use them for molecular electronics or molecular optics.

It does not matter whether or not the molecule of Van Allen et al is bistable or looks bistable; the molecules of Van Allen et al have totally different properties from Applicants' molecules, as well as totally different applications.

For the molecules of Van Allan et al, whether or not some portion of the molecule can rotate or twist is unimportant; all that those portions of the molecule do is to combine to form a certain permanent color with an easily chargeable structure, so that when they are electrically photo-charged, the photo-charged materials can undergo an electrophoretic migration from one electrode surface to another electrode surface to form an image. For Applicants' device molecules, intra-molecular twisting or rotation is their unique property imparted by electric-field (E-field) induced molecular switching. Both optical and electrical properties of the molecular device will be changed under the influence of an external electric field. Applicants use their unique method of patterning their molecular circuitry for their switchable molecular electronics applications.

Page: 17

Summarizing, Van Allan et al utterly fail to disclose or even remotely suggest a bistable molecule including at least one photosensitive, photodecomposable functional group. Applicants' Claim 1 is amended to distinguish the aspect of photodecomposition, as disclosed in, for example, paragraphs 0065, 0066, 0072, 0073, 0075, 0079, 0081, 0104, 0122, 0123, and 0136, as well as FIG. 6 and the text associated therewith.

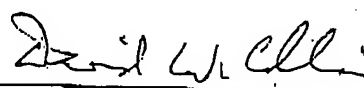

Reconsideration of the rejection of Claims 1, 6, 8, and 9, as amended, under 35 USC 102(b) as being anticipated by Van Allan et al is respectfully requested.

The Examiner indicates that Claims 10-15 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. Applicants appreciate that these claims are allowable. Applicants, however, urge that the limitations now recited in Claim 1 render this claim allowable over each of Van Allan et al and Fay et al.

The application, as amended, is considered to be in condition for allowance. The Examiner is respectfully requested to take such action. If the Examiner has any questions, he is invited to contact the undersigned at the below-listed telephone number. HOWEVER, PLEASE CONTINUE TO ADDRESS ALL FURTHER WRITTEN CORRESPONDENCE TO: IP ADMINISTRATION, LEGAL DEPARTMENT, M/S 35, HEWLETT-PACKARD COMPANY, P.O. BOX 272400, FORT COLLINS, CO 80527-2400.

Respectfully submitted,

November 8, 2005
